Hi all

I have a container with Ubuntu 11.04

Not starting NFS kernel daemon: no support in current kernel (Linux 2.6.32-4-pve)

I have load the module nfs in host and adding this to container:

```
# vzctl set 101 --features "nfs:on" --save  
# vzctl start 101
```

But when I try to restart nfs-server i get:

```
/etc$ sudo /etc/init.d/nfs-kernel-server restart  
* Stopping NFS kernel daemon  
[ OK ]  
* Unexporting directories for NFS kernel daemon...  
[ OK ]  
* Not starting NFS kernel daemon: no support in current kernel.
```

What is the problem??

Thanks
