I didn't have time to read you entire message, but in my experience, OpenVZ's containers lose their network connectivity if anything happens to the host's IP. To work around this, I have a script that does this to all running containers:

```
vzctl set ${NUMBER} --ipdel ${IP_OF_CONTAINER}  
vzctl set ${NUMBER} --ipadd ${IP_OF_CONTAINER}
```

This resolves these kinds of issues:

- Sam
