cybernet2u, OpenVZ and CentOS aren't connected in any way. Latest OpenVZ RHEL 6 kernel is the latest RHEL 6.1 kernel + OpenVZ patch.

To perhaps give a suggestion to the original poster - AFAIK, only RHEL 4, 5 and 6 kernels are currently supported by the OpenVZ developers. Perhaps you could try using the RHEL 6 kernel under Gentoo and if the problem still persists, the solution might be easier to find here?

I'm not familiar with the Gentoo project structure, perhaps they have an openvz maintainer (I assume your kernel comes from Gentoo itself?) who could provide more information to your particular case?
