Hi,

I am using openvz kernel on debian squeeze, when I do an  
/etc/init.d/vz start, I got some errors popping up:

```
===== =  
12:38 root@abcde /var/lib/vz/lock# /etc/init.d/vz start  
/etc/init.d/vz: line 347: /var/lock/subsys/vz_lock.6315: No such file  
or directory  
Can't write to /var/lock/subsys/vz_lock.6315  
cat: /var/lock/subsys/vz_lock: No such file or directory  
/etc/init.d/vz: line 362: /var/lock/subsys/vz_lock: No such file or directory  
Starting OpenVZ: ..done  
Bringing up interface venet0: ..done  
Starting CT 40042237: ..done  
touch: cannot touch `/var/lock/subsys/vz': No such file or directory  
===== =
```

I just created the missing dir:

```
mkdir -p /var/lock/subsys
```

And it worked again.

Any debian guys on the list?

Best,

"In July 2005, after several failed attempts to legalise software patents in Europe, the patent establishment changed its strategy. Instead of explicitly seeking to sanction the patentability of software, they are now seeking to create a central European patent court, which would establish and enforce patentability rules in their favor, without any possibility of correction by competing courts or democratically elected legislators."
