---

We have a pretty new network infrastructure.. and i need to get my openvz hosts to work with it..

As configured we have

- default dropped
- vlan 730 = direct internet and SSH
- vlan 722 = iscsi

On the HN I have configured

eth0 = dummy

eth0.730 = internet

eth0.722 = iscsi

eth1 = dummy

eth1.722 = iscsi

eth2 = dummy

eth2.722 = iscsi

eth3 = dummy

eth3.722 = iscsi

venet0

Normally the Venet uses eth0 to talk to the outside world in this case it needs to be eth0.730. I can't use bridging because if i do that i can not ssh to the HN anymore. any suggestions ?

I use Debian 6, kernel: 2.6.32-5-openvz-amd64, vzctl 3.0.24
