Is this on a 2.6.32 RHEL kernel? Looks related to this buffer overflow bug:

http://bugzilla.openvz.org/show_bug.cgi?id=1654 (patch available).

Also in regards to my previous post about "-fwriteable-strings" not being available any more, others have noticed too:

http://bugzilla.openvz.org/show_bug.cgi?id=950 (patch available).

I thought it would have other consequences and didn't research further, but it's just a simple configure tweak. Well, I should look at the Bugzilla more closely in the future and save myself some time.

Anyway, looks like vzprocps would need a bit of love & attention.
