I cannot get the vlans to work inside the container..

I have the followin interfaces on the HN

eth0 - dummy

eth0.730 - internet and ssh to HN

eth0.722 - iscsi

eth1 - dummy

eth1.722 - iscsi

eth2 - dummy

eth2.722 - iscsi

eth3 - dummy

eth3.722 - iscsi

Normally if eth0 is the default gateway interface to internet this one is being used bij de VE. In this case it should use the eth0.730 bridging is not possible because it will disable my ssh connection to the HN.

both the HN vlan0.730 and the VE should have their own external ip adres. Like 194.162.215.20 (HN) and 194.162.215.21(VE) (yes they are dummies)
