Dear all,

If you have kernel crashes please follow these instruction
http://wiki.openvz.org/When_you_have_an_oops#If_you_have_had_an_oops

shortly:

- please switch to last released kernel, your issue can be fixed already.
- please check your hardware and be sure that it isn't hardware-related issue
- please configure remote console (serial- or netconsole) and to save kernel messages on another node.

http://wiki.openvz.org/Remote_console_setup

Alternatively you configure kdump, it allows to save kernel core dump. Kernel messages of crashed kernel can be extracted from this core dump

- then please submit new bug to bugzilla.openvz.org

thank you,
Vasily Averin
