dev wrote on Wed, 05 July 2006 06:43if 2.6.8 and you are using conntacks, then don't forget to enable them as descibed in FAQ:

As mentioned elsewhere I added the `ip_conntack_enable_ve0=1` to `/etc/modules.conf`. Then I removed the `ip_conntack` module and did a `modprobe` to load it again. No luck. Then I rebooted the machine and tried again and used the folowing:

```
# modprobe -v ip_conntack ip_conntack_enable_ve0=1
```

Then it worked. Just to be sure I restarted the computer again, and did a normal `modprobe` (which should use the options in `/etc/modules.conf` I think) and it didn't work. Removing the module and do it again met the above command doesn't work. The only way to get it working is doing the above command before the module is loaded through another method.

Is this a bug or is this the normal way? If so, then I think that the manual must be changed .
