Hi madsere,

Sorry i was in a rush to get it sorted and my fingers work quicker than my brain.

I have this setup:

HOST CENTOS

VPS DNS
VPS MYSQL
VPS WEB SERVER

I have setup a test domain and setup bind9 and if i enter dns vps and set the nameserver as
127.0.0.1, the ip of the domain comes back fine. When i set the nameserver to the ip of the dns
vps on the host it does not work. I know i have done eveything right on the dns side and also i
have not had a problem before only when setting it up on a vps (openvz) so i just wondered if
there's anything in place that stop communication of any sort.

Or is it me not doing something right?
