Hi,

I am trying to recompile the debian kernel with openvz patches, but it compiles me all the flavors of the kernel:

```
=====
$ ls -1
firmware-linux-free_2.6.32-35_all.deb
linux-2.6-2.6.32
linux-2.6_2.6.32-35_amd64.build

xen-linux-system-2.6.32-5-xen-amd64_2.6.32-35_amd64.deb
=====
```

Any idea how to compile only the openvz flavor?

Is it an option of make-kpkg?

Best,

--

"In July 2005, after several failed attempts to legalise software patents in Europe, the patent establishment changed its strategy. Instead of explicitly seeking to sanction the patentability of software, they are now seeking to create a central European patent court, which would establish and enforce patentability rules in their favor, without any possibility of correction by competing courts or democratically elected legislators."
