After a recent kernal update on a HyperVM node running centos 5.7 I am constantly getting "can't load ipv6 module due to service vz is started" in the console terminal.

It does not appear to be affecting server operation, but it's rather annoying.
sysctl.conf has no ipv6 instructions in it
vz.conf has ipv6 disabled

Kernal = 2.6.18-274.3.1.el5.028stab094.3 x86_64
