I'm setting up a new box with a /29 and openvz and I wonder what is the recommended way to do the IP configuration? Nat or Bridge? I'm familiar with FreeBSD jails and in that case I think all I had to do was add the container/jail ips as aliases on eth0, the rest just worked. I've seen tutorials for NATing and Bridging traffic through venet0 but I'm wondering what the best way would be for my setup. Since i have a /29 the first IP will be the host and the other 4 will be containers, each should have their own public IP. How do I forward traffic to them so they respond just as if they were physical boxes?

Thank you!
