A good starting point is
http://wiki.openvz.org/Resource_shortage
and
http://wiki.openvz.org/UBC_parameter_units

IMHO the most "critical" resource settings are
kmemsize (bytes) : Max size of kernel memory used by VE
privvmapges (pages): Max number of "private" memory pages used by VE
shmpages (pages): Max number of pages for shared memory segments

and additionally the quota and number of inodes for a VE.

Regards

Andreas
