---

I'm using OpenVZ to virtualise a MPP cluster and its great.

However I can;t get native infiniband user space protocols to work inside my containers.  
The IPoIB works fine but I need OpenMPI to access the lower level protocols on the VM

The OFED.org ste indicates that virtualisation is supported on the card, so it *\*SHOULD\** be possible under OpenVZ.

A overview of IB virtualisation is available here:

[www.mellanox.com/pdf/whitepapers/WP\\_Virtualize\\_with\\_IB.pdf](http://www.mellanox.com/pdf/whitepapers/WP_Virtualize_with_IB.pdf)

To try and hack a test VM into compliance I have even tried linking the proc and sys filesystems to the host (yuk), but I still cant get basic driver recognition in VM user space.

All drivers are installed on the VM but modprobe can't find some of them - no idea why.

I am using the Melanox version of OFED 1.5.3.1.0.0.2 on Centos 5.7 (host and VM).

Any ideas?

Is there any plan to implement a module equivalent of Xen-IB module?

I am desperate to solve this, if it cant be done, I will have to use a different virtualisation system.

Thanks in advance,

Randolph
