So.. is it a major security risk if I can't recompile pureftp-d and I'm forced to use those capabilities
?

Would those capabilities turned on for the container help affect in any way the node, in case the
container gets rooted ? In other words, can those extra added capabilities for the container
represent a security hole (for the container and/or node)?

I'm thinking that even without running OpenVZ, on a normal [for example] Ubuntu installation
those capabilities are required by the ftp server and people don't panic that much about it.

Thanks,
Dan
