What is dangling 'else' for ?

```

Hmm..can't we have a good way for avoiding this #ifdef ?

I guess... as NUMA_BUILD macro in page_alloc.c, you can define

if (HAS_KMEM_LIMIT && static_branch(&.....)).

For example,

==

```
#include <stdio.h>
```

```
#define HAS_SPECIAL 0
```

```
int main(int argc, char *argv[])
```

```
{
    if (HAS_SPECIAL)
        call();
```

```
    printf("Hey!");
}
```

==

This can be compiled.

So. I guess...

```
#ifdef CONFIG_CGROUP_MEM_RES_CTLR
#define do_memcg_kmem_account static_branch(&memcg_socket_limit_enabled)
#else
#define do_memcg_kmem_account 0
#endif
```

maybe good.(not tested.)

BTW, I don't think 'goto nocgroup' is good.

```

```

Why do you need this move of definition ?

Thanks,
