still: what do you mean by "online". what is the state of the VPS when vzlist is issued after vzctl start 105, and what is the output of the latter?

a VPS could be booted an still not be "online", as the services/daemons may fail to start. if vzctl start 105 exits with "Container start in progress..." and no following error message you should be able to enter a VPS by using vzctl enter 105.
