Subject: More info: it has to do with the template
Posted by plotinus on Mon, 05 Dec 2011 22:02:36 GMT

I've used the same template for all containers: the standard fedora 15 x86_64, with some changes: mysql, and security issues.
Now, I've used the standard ubuntu 11.04 template plus mysql and it works!
Does anybody know why the fedora template doesn't work?
I've copied the ubuntu's my.conf file into the fedora template, but it doesn't work.
Thanks in advance,
P
