## Subject: fedora 15 template and mysql

Hi all,
I've been struggling with a problem for days (see post
h-t-t-p-://forum.openvz.org/index.php?t=msg&th=10181&amp ;goto=44068&#msg_44068 -Sorry,
but I can't put links in topics).
My server has room for 70 containers. I want all of them to be fedora 15 + mysql.
When I create/reboot them, only for the 24 first ones can mysqld start.
Today I've tested using ubuntu 11.04 template, and with it all the 70 containers can run mysqld.
The my.conf ubuntu file doesn't work with fedora (I mean, mysqld doesn't start).
Does anybody know what I've done wrong with fedora 15 template? I just installed mysql, created
a mysql user and database, and a few little changes (securize ssh, create directories and so on).

Thanks,
P
