Quote:I configured network as "venet". All was ok. Ubuntu works. I could log in to main machine ( proxmox debian ) and individual virtual machines ( on ubuntu ) using "putty" from another computer. They worked correctly but it looks like this network model does not allow setup multiple containers which use the same ports.

Sure it does... I have numerous applications on same ports (on different IPs, of course) running venet networking. The cause of your port conflicts must be elsewhere.

I'd start troubleshooting from here, as venet is the recommended way to go - unless there is something specific about veth that you really need.
