I said cpulimit, not cpuunits

in your config you are setting limit 90

please take a note, that to calculate cpulimit you have to sum all cores which you give for CT so if you have 8 cores cpu all power is 800%

8cores*100% = 800

if you want that CT don't use more than 50% of cpu you have to set it to 400 with limit 90 you set $\sim 10\%$ of cpu power.

if you set for CT 2 cores (--cpus X) than to calculate limits you need to sum: 2cores*100%=200% with limit 90 it would be little bit less than 50%
