hi all
I'm doing sth on openvz migration and want to skip the sync time

I put the container's private area on the share storge which both the
src node and the des node can access.
then I modify the vzmigrate script simply.
I skip the sync part, umount the private of the container on src node,
mount it on des node.
But it sometimes works and sometimes cause INPUT/OUTPUT ERROR!

Does anyone have some cue or suggestion?]
