Hi, All

For many days I have been trying to get my OpenVZ VM to work with Netfilter Queue.

The VM IPtables version is 1.4.3 and the kernel is : 2.6.18

OS is Centos 5.5

The VM provider has said that nfnetlink_queue and nfnetlink IPTables modules are loaded on the VM. But when I attempt to run the command:

```
iptables -A FORWARD -j NFQUEUE
```

I get IPtables errors as follows:

```
iptables: Unknown error 4294967295
```

Please how can I fix this error and make OpenVZ VPS use NFQUEUE?

Thanks
