Subject: Re: inconsistent physpages when validating config file
Posted by Artem on Tue, 27 Dec 2011 10:55:53 GMT

can you provide your OpenVZ kernel version (uname -sr) ?

What are 'vmguarpages' and 'privvmpages' values set in your config? (I suppose they are set to near 256m). It is possible that you are using non-VSwap kernel, then you need to set physpages to 0:MAXLONG and use other *pages to configure memory.

wiki.openvz.org/VSwap
