I can confirm this to be the case although I wouldn't use the word "disaster" nor "shit"... but to each his own.

I have a container made from an earlier official OS template release and the file in question is 755 where the current OS template shows:

```
[root@sl6test32 /]# ls -lha /etc/cron.hourly/0anacron
-rw-r--r-- 1 root root 424 Mar 26 2011 /etc/cron.hourly/0anacron
```

```
[root@sl6test32 /]# rpm -qf /etc/cron.hourly/0anacron
cronie-anacron-1.4.4-7.el6.i686
```

```
[root@sl6test32 /]# rpm -V cronie-anacron-1.4.4-7.el6.i686
.M..... /etc/cron.hourly/0anacron
```

Luckily it is an easy problem to find and fix. Thanks for reporting the bug. I await an updated OS Template. To the best of my knowledge, the issue isn't present in the my contributed SL OS Templates.

TYL,
