Could you explain, what are you proposing? I still don't know any details about it.

>>> Especially what drives that desire not to have it have a /proc/<pid>/sys>>> directory that reflects the sysctls for a given process.

>

Probably I don't understand you, but as I see it now, symlink to "/proc/self/" is unacceptable because of the following:

1) will be used current context (any) instead of desired one

1) if CT has other pid namespace - then we just have broken link.
