There are so many interesting Linux distributions out there, but switching from one to another have been a nightmare. Thus I have a vision of installing a semivirtualized system where I can install any distribution I like side by side.

But I do not want to is not to have a random distribution and connecting from that to openvz using X. I want to have openvz running the X natively. So if I press ctrl-alt-F2 i get Fedora, and on ctrl-alt-F3 I get ubuntu etc.

My homedir I would keep on an mounted /home dir.

Thus I could try out a new distribution withing 10 minutes, and switch back right away if the new distribution is buggy.

It would also be possible to eg. protect my webserver in a container by it self.
