Subject: [PATCH 0/6] Lockd: make it network namespace aware
Posted by Stanislav Kinsbursky on Tue, 31 Jan 2012 11:07:38 GMT

With this patch set Lockd will be able to handle lock requests from different network namespaces separately.

Main ideas of the patch set are:

1) per-net Lockd users counter and resources.

2) nlmsvc_users counter become global one (equal to sum of all per-net counters).

3) On lockd_up() call:
a) if nlmsvc_users if equal to 0, then lockd thread is started.
b) if current per-net counter equal to 0, then per-net resources are allocated (lockd_up_net() function).
c) global and current net users counters are increased by one.

4) On lockd_down() call:
a) global and current net users counters are decreased by one.
b) if current per-net counter become equal to 0, then per-net resources are allocated (lockd_down_net() function).
c) if nlmsvc_users become equal to 0, then lockd thread is stopped.

The following series consists of:

Stanislav Kinsbursky (6):
      Lockd: create permanent lockd sockets in current network namespace
      Lockd: pernet usage counter introduced
      Lockd: per-net up and down routines introduced
      LockD: make nlm hosts network namespace aware
      LockD: make NSM network namespace aware
      Lockd: shutdown NLM hosts in network namespace context
