I just wanted to say that I have small set of servers running centos6 servers with rhel6 based openvz kernels with running centos5 or centos6 CT's inside them and did not have any issues of kernel panicks or whatever. it works like a charm.

I suggest that you use latest stable kernel, and if you still have issues and can provide why server crashes than submit a bug report.

p.s. I use 2.6.32-042stab044.xx kernel versions
