Perhaps we should use the opportunity to make this comment shorter, so it can fit in a single line. How about:

/* per-subtree hierarchical accounting */ ?

Although I like this change in principle, the end result is that many of the lines we are touching, used to be single-lines and now span two rows. I know not everybody cares about that, but maybe we could provide functions specific to each flag?

For the record, that is what cgroup.c does:

```

static int notify_on_release(const struct cgroup *cgrp)
{
    return test_bit(CGRP_NOTIFY_ON_RELEASE, &cgrp->flags);
}

```

```

static int clone_children(const struct cgroup *cgrp)
{
    return test_bit(CGRP_CLONE_CHILDREN, &cgrp->flags);
}

```

```
