Can you please report slabtop output? We've just fixed obe memory leak. Thanks!

While the ploop-based containers are basically working, in my testing a ploop-based CT seems to
require more resources than an equivalent simfs-based CT. On my modest 32 bit test rig with 1
GB RAM, I've been running dbench on simfs based CTs and looking at performance with new
kernel versions. But when running dbench tests on a ploop based CT with the same resources, it
has not been able to finish because the machine runs out of resources, performance slows to a
crawl and even host processes are killed off.
