Subject: OpenVZ CentOS6.2 no onboot?!

Hi,

We recently setup a new node, running CentOS6.2 x64, all running well but for some reason, none of the OpenVZ containers had onboot set on them, we are using SolusVM to manage it but this sounds more like a OpenVZ issue.

Is there any global config such as vz.conf where we can add ONBOOT to set all containers to boot?

We also have another node, running CentOS5.7 x64 running OpenVZ, but all containers were set to start on boot automatically.

Any help / comments are greatly appreciated!

Thanks,
Cameron
