I just may be overly dense lately but I can't seem to figure out how to move the association of venet0 from eth0 to eth3. The host is dual homed and I want the virtuals to attach to the eth3 not eth0

Output:

```
[root@harpalyke ~]$ ip route show
10.30.102.101 dev venet0 scope link src 10.30.100.23
10.30.100.0/24 dev eth0 proto kernel scope link src 10.30.100.23
10.30.102.0/24 dev eth3 proto kernel scope link src 10.30.102.23
169.254.0.0/16 dev eth3 scope link
default via 10.30.100.2 dev eth0
```

Kind of important for an upcoming launch date, please help !
