---

v2: dereference of most probably already released nlm\_host removed in nlmclnt\_done() and reclaimer().

These routines are called from locks reclaimer() kernel thread. This thread works in "init\_net" network context and currently relays on persence on lockd thread and it's per-net resources. Thus lockd\_up() and lockd\_down() can't relay on current network context. So let's pass corrent one into them.
