hi

Using 2.6.8-022stab078-smp

I have problems using iptables nat on host computer with the ovz kernel.

I am trying to use static NAT one-to-one, from a ip placed on eth1 to a secondary ip on venet0 placed on eth0 but not work on ovz host machine, the iptables rules work on others machines with generic kernel.

192.168.153.252 --- eth1:0 Host Computer IP
192.168.100.153 --- venet0:1 VPS Secondary IP

Rules

```
iptables -t nat -A OUTPUT -d 192.168.153.252 -j DNAT --to-destination 192.168.100.153
```

```
iptables -t nat -A PREROUTING -d 192.168.153.252 -j DNAT --to-destination 192.168.100.153
```

I need made NAT from 192.168.153.252 to 192.168.100.153

Note: On other generic Kernels this rules work, but on the vz kernel not work. any IDEA?
