Thanks much, I would use kvm but as this is an atom netbook it is not supported and I need the solution that uses the least processor.

Btw I see there is something called lxc that appears to (from what I see doing a yum search) incorporate into the more recent kernels, would this be viable on fedora? is it very similar to openvz? I think I am ready to put centos on the laptop but was just wondering about peoples thoughts on lxc as it says it is a container based solution as well (which is what I will need one way or another on the netbook).

Thanks much.
