
Subject: How to determine a container from the filesystem?

I just found out through the proxmox-ve forums that running ntp on a container is considered a Bad Thing. So I am reworking my puppet installation to disable ntp on the containers...But I was trying to figure out a foolproof way of looking on the machine and determining if it is a container or not. The only thing I have found so far is that /proc/mtrr exists on the physical servers, but not on the containers. Is this a viable way to make this determination or is there a better way?

Thanks,
