Not necessarily. In fact, it's a good thing to run ntpd inside a container, it's just you need to

1. Have only ONE container doing that.
2. Grant that container sys_time capability, so it will be able to set system time.

This is because time is not virtualized, ie all the containers share the same time (because indeed there's only one time -- time zones of course can be different).

Solutions provided here in this thread by E Frank Ball and Martin Dobrev are both good.
