I just install ovzkernel-2.6.18-308.el5.028stab099.3.i686.rpm on Centos 5.8

When I boot I get a kernel panic, see attached

The system runs fine with the old kernel, ovzkernel-2.6.18-274.7.1.el5.028stab095.1.i686.rpm

I have a crash dump file but it is too big to attach, 1.4GB

Richard
