Subject: [PATCH 00/23] slab+slub accounting for memcg
Posted by Glauber Costa on Fri, 20 Apr 2012 21:57:08 GMT

View Forum Message <> Reply to Message

Hi,

This is my current attempt at getting the kmem controller
into a mergeable state. IMHO, all the important bits are there, and it should't
change *that* much from now on. I am, however, expecting at least a couple more
interactions before we sort all the edges out.

This series works for both the slub and the slab. One of my main goals was to
make sure that the interfaces we are creating actually makes sense for both
allocators.

I did some adaptations to the slab-specific patches, but the bulk of it
comes from Suleiman's patches. I did the best to use his patches
as-is where possible so to keep authorship information. When not possible,
I tried to be fair and quote it in the commit message.

In this series, all existing caches are created per-memcg after its first hit.
The main reason is, during discussions in the memory summit we came into
agreement that the fragmentation problems that could arise from creating all
of them are mitigated by the typically small quantity of caches in the system
(order of a few megabytes total for sparsely used caches).
The lazy creation from Suleiman is kept, although a bit modified. For instance,
I now use a locked scheme instead of cmpxcgh to make sure cache creation won't
fail due to duplicates, which simplifies things by quite a bit.

The slub is a bit more complex than what I came up with in my slub-only
series. The reason is we did not need to use the cache-selection logic
in the allocator itself - it was done by the cache users. But since now
we are lazy creating all caches, this is simply no longer doable.

I am leaving destruction of caches out of the series, although most
of the infrastructure for that is here, since we did it in earlier
series. This is basically because right now Kame is reworking it for
user memcg, and I like the new proposed behavior a lot more. We all seemed
to have agreed that reclaim is an interesting problem by itself, and
is not included in this already too complicated series. Please note
that this is still marked as experimental, so we have so room. A proper
shrinker implementation is a hard requirement to take the kmem controller
out of the experimental state.

I am also not including documentation, but it should only be a matter
of merging what we already wrote in earlier series plus some additions.

Glauber Costa (19):

slub: don't create a copy of the name string in kmem_cache_create
slub: always get the cache from its page in kfree
slab: rename gfpflags to allocflags
slab: use obj_size field of struct kmem_cache when not debugging
change defines to an enum
don't force return value checking in res_counter_charge_nofail
kmem slab accounting basic infrastructure
slab/slub: struct memcg_params
slub: consider a memcg parameter in kmem_create_cache
slab: pass memcg parameter to kmem_cache_create
slub: create duplicate cache
slub: provide kmalloc_no_account
slab: create duplicate cache
slab: provide kmalloc_no_account
kmem controller charge/uncharge infrastructure
slub: charge allocation to a memcg
slab: per-memcg accounting of slab caches
memcg: disable kmem code when not in use.
slub: create slabinfo file for memcg

Suleiman Souhlal (4):
  memcg: Make it possible to use the stock for more than one page.
  memcg: Reclaim when more than one page needed.
  memcg: Track all the memcg children of a kmem_cache.
  memcg: Per-memcg memory.kmem.slabinfo file.
