---

I have created an interface veth0, and inside the VPS, appears like eth0.(vzctl set --veth\_add ....)

If i want remove this interface i must to do:  
vzctl set --veth\_del ...

The problem is that when i do this, vzctl removes veth0 but eth0(VPS interface) continues there, inside the VPS.

Any way to removes eth0?

Thx.

-----

The problem was an error of my system, not openvz
