Hi Thorsten,

Perhaps you have a newer version of asterisk. In my version, if one wants to use a telephone line input (zapata/zaptel), then it is necessary to create /dev/zap directories, in which case, these would also need to be managed by the VE and given access through DEVICES. If the PBX is doing only VoIP (SIP, etc.) then this may not be necessary.

Based on other posts, I would think that a VE-based Asterisk system would have a problem handling audio devices. Do you have any experience in this area?

Regards,  
rollinw
