Replied in bugzilla, copy-paste from bz follows:

Now, the problem is your physpages is not set the way it should. Newer vzctl is just able to detect it, while the old one didn't care. So this is the bug with your CT configuration, not vzctl.

If you look up the description of physpages (<http://wiki.openvz.org/Physpages#physpages>), you will note this:

- > For older kernels, physpages is an accounting-only parameter.
- > The barrier should be set to 0 and the limit to 'unlimited' (LONG\_MAX).

So, the way to fix your CT config is:

```
vzctl set NNN --physpages 0:unlimited --save
```

Again, I am really sorry that new vzctl broke your CT start, but the problem is indeed with CT config not vzctl.
