dzimi wrote on Sat, 05 May 2012 14:49 Your setup won't work. Use private IP address for your VPS and then create a SNAT or MASQ for your private IP.

Like:

```
iptables -A POSTROUTING -t nat -o eth0 -s YOUR_PRIVE_IP -j SNAT --to YOUR_PUBLIC_IP
```

don't forget to switch ip\_forwarding to 1

Hello dzimi,

first thank you man for your kind reply

why it wont work ?

is it because itsnt allowed to use HN IP in a vps ?

should i have to use SNAT ? because we just want to use public IP addresses for each VPS ?

ps, i have already enabled ip forwarding in the main HN

please accept my best regards,,
