I've updated kernel to RHEL6 042stab055.10.
And system is rebooting after saying "iTCO_wdt: Unexpected close, not stopping watchdog!" in /var/log/messages.

I've never configured IPMI watchdog timer.
so I wonder that message is appeared.

Unfortunately, the server which was rebooted with this message is not configured to take console messages and crash dump.
So I cannot explain details of this problem. sorry.
If someone can know about this, please tell me that.
