I'm sorry for being a pest but once I can get past this issue I can go to Prod.

When I use VZ on a single nic machine everything is fantastic but when I am on a multihomed system I need to be able to control which NIC the traffic on the virtuals attach, especially the default gateway. I have been fiddling with this for two weeks and really need to help with what I'm sure is a easy solution.

So, said bluntly ... How do I "attach" a VM to a NIC on a multihomed system when the default gateway on the VM is not the default gateway of the host ?
