If you want a set of VEs to use one interface and gateway and another set of VEs to user another interface/gateway, you need to setup IP source based routing in host system.

Check http://wiki.openvz.org/Source_based_routing
it is a draft I took from forums here.

In a few words: you need to make host system to route some of your packets from VEs to if1/gw1, and another set of IPs (VEs) to if2/gw2. This is done purely by routing.
In developement OpenVZ version with 2.6.16 kernel it is also possible to do it with veth devices and bridges, but I wouldn't bother with it in your case.
