Daniel,

Please let me know what you think of the attached patch. It is ontop of Eric's tree that you pointed me to, but I am not really using any of its functionality, so this would be equally doable in current mainline kernel - but I wanted to make sure it integrates well with what Eric is doing as well.

It is a bit wasteful space-wise, but this approach pretty much guarantees we don't need to update pointers anywhere - therefore, totally lock-free. pid->level is only updated after switch_task_namespaces(), so every call before that will see correct

information up to the previous level.
