By "yum update kernel" get grub.conf automatically updated to.

Old kernel-start-line becomes an "/boot" on the path and goes down in the file view. (on screenshot: I had changed textblocks in grub.conf for fallback reasons).

When kernel panic occurs - goes grub/load-process to the old start-line AND this entry works well!
- with this "/boot"!

AND i had tried a kernel-start-line without this "/boot" - no effect.

AND finally - with original Centos-62-minimal - get the old kernel-start-line such "/boot" to - but the update works well!

It seems to be a little bit more complicated issue...

Any ideas more ..?!
